

Read Me First

*for the ProCurve Manager, Version 1.6
and ProCurve Identity Driven Manager 1.0*

To install PCM+, simply insert the product CD into the CD ROM drive in the computer that you want to use for your network management station. The program will auto install. If, for whatever reason, the auto install doesn't work, run the **Install.exe** program from the CD ROM drive.

The install script will check your system configuration to determine the appropriate components to install; either PCM 1.6 standard, or PCM for OV-NNM.

During an upgrade installation the PCM installer will migrate configurations currently stored in the PCM 1.5 database to the new 1.6 database.

Saving the Configuration Before Installing a New Version:

Before initiating the installation process, it is recommended that you back up the PCM/server/db/solid.db database file. This will allow you to restore the previous version if necessary.

For details on installing and licensing HP ProCurve Manager, refer to *HP ProCurve Manager Getting Started Guide*, that came with your software CD.

To install the Identity Driven Manager 1.0 software, you can select the IDM 1.0 during the PCM+ installation process. You can also use the PCM+ CD to install the IDM 1.0 release at any time. Just re-run the Install.exe program, and select the IDM 1.0 option.
